AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing Of Claims:

1-19 (Canceled)

- 20. (New) A safety device for a vehicle that can be activated upon an impact of the vehicle against an obstacle, comprising:
- a) a first sensor arrangement for acquiring the vehicle impact and for outputting a first sensor signal;
- b) a control device for outputting a triggering signal dependent on the first sensor signal;
- c) a restraint system that is triggered dependent on the first sensor signal for a protection of a vehicle occupant during the vehicle impact;
- d) a second sensor arrangement for acquiring the obstacle in a vicinity of the vehicle and for outputting a second sensor signal; and
- e) a third sensor arrangement for acquiring an environmental influence on the second sensor arrangement and for outputting a third sensor signal dependent on the environmental influence, wherein:

the control device determines, based on the second sensor signal, whether to trigger the restraint system after an evaluation of the third sensor signal.

- 21. (New) The device as recited in Claim 20, wherein the first sensor arrangement includes an acceleration sensor.
- 22. (New) The device as recited in Claim 20, wherein the second sensor arrangement includes an ultrasound sensor.
- 23. (New) The device as recited in Claim 20, wherein the restraint system includes a multiplicity of restraint devices.

- 24. (New) The device as recited in Claim 23, wherein the restraint devices include at least one of a driver airbag, a passenger air bag, a knee airbag, a window airbag, a belt tightener, a seat actuator, and a roll bar.
- 25. (New) The device as recited in Claim 20, wherein the first sensor arrangement, the second sensor arrangement, and the third sensor arrangement form a sensor system.
- 26. (New) The device as recited in Claim 20, wherein the third sensor arrangement includes at least one of:

a rain sensor,
a temperature sensor,
an adhesive friction sensor,
an additional system for determining an adhesive friction,
a video sensor, and
an intrinsic speed sensor.

27. (New) A method for activating a safety device for a vehicle upon an impact of the vehicle against an obstacle, comprising:

acquiring a first sensing variable by a first sensor arrangement for recognizing the vehicle impact against the obstacle;

outputting a first sensor signal via the first sensor arrangement;

determining by a control device a triggering signal dependent on the first sensor signal; triggering a restraint system dependent on the first sensor signal for protecting a vehicle occupant during the vehicle impact against the obstacle;

acquiring a second sensing variable by a second sensor arrangement for recognizing the vehicle impact against the obstacle;

outputting a second sensor signal from the second sensor arrangement;

acquiring a third sensing variable by a third sensor arrangement for recognizing an environmental influence on the second sensor arrangement;

outputting a third sensor signal from the third sensor arrangement dependent on the environmental influence; and

causing the control device to determine, based on the second sensor signal, whether a triggering of the restraint system is to occur after an evaluation of the third sensor signal.

NY01 911467 v1 4

- 28. (New) The method as recited in Claim 27, wherein the evaluation of the third sensor signal output by the third sensor arrangement is carried out in the control device by a processor unit.
- 29. (New) The method as recited in Claim 28, wherein the evaluation of the third sensor signal is carried out in the processor unit by way of an evaluation algorithm.
- 30. (New) The method as recited in Claim 29, wherein the evaluation algorithm is embedded in the processor unit.
- 31. (New) The method as recited in Claim 27, further comprising: acquiring an ambient brightness via one of a video sensor and a brightness sensor of the third sensor arrangement.
- 32. (New) The method as recited in Claim 27, further comprising:
 acquiring the environmental influence via one of a temperature sensor and a rain sensor of
 the third sensor arrangement.
- 33. (New) The method as recited in Claim 27, further comprising:

 determining from another signal present in the vehicle an adhesive friction between the vehicle and a roadway by an adhesive friction sensor of the third sensor arrangement.
- 34. (New) The method as recited in Claim 33, further comprising:

 determining at least one of a dirtying and an icing of the second sensor arrangement based on the adhesive friction between the vehicle and the roadway.
- 35. (New) The method as recited in Claim 27, further comprising: switching the restraint system to a fallback level if the evaluation of the third sensor signal in the control device yields a result that the second sensor signal is falsified by the environmental influence.
- 36. (New) The method as recited in Claim 35, further comprising:
 when a restraint system control unit is switched to a fallback level, triggering a restraint device of the restraint system without making use of the second sensor signal, on the basis of the first sensing variable.

NY01 911467 v1 5

- 37. (New) The method as recited in Claim 27, further comprising:
 acquiring, based on the second sensor signal, a relative speed and a distance between the
 vehicle and the obstacle, an angle of impact, a time of impact, and a shape of the object.
- 38. (New) The method as recited in Claim 29, wherein a decision concerning a triggering of the restraint system is carried out by the evaluation algorithm executed in the processor unit.
